

Tasks to be implemented as part of the project P2

1. The data set concerns an online store <https://shop.merch.google/>
2. The data is available free of charge from your Google Analytics account. A description is available on the website <https://support.google.com/analytics/answer/6367342?authuser=1#zippy=%2Cin-this-article>.
3. Data is available after logging in <https://analytics.google.com/analytics/index/demoaccount?appstate=/p213025502> using student gmail account.

The exercise involves analyzing the purchasing process:

- a) on a selected day in March or April of this year, taking into account the entire day
- b) for a selected day as above, but narrowing it down to a specific time (e.g., 5:00 PM - 6:00 PM UTC).

Create a Customer Behavior Model Graph (CBMG) for a user making a purchase in the online store <https://shop.merch.google/>.

The analysis should include total revenue for the selected period, total revenue from product sales, and identify which products generate the highest revenue and which are most frequently purchased. Furthermore, it should show the customer's path to purchase, the store pages with the highest number of views, the highest number of events (show events), and the highest number of active users.

Analyses should consider the purchasing process lifecycle:

- I. Customer acquisition
- II. Customer engagement

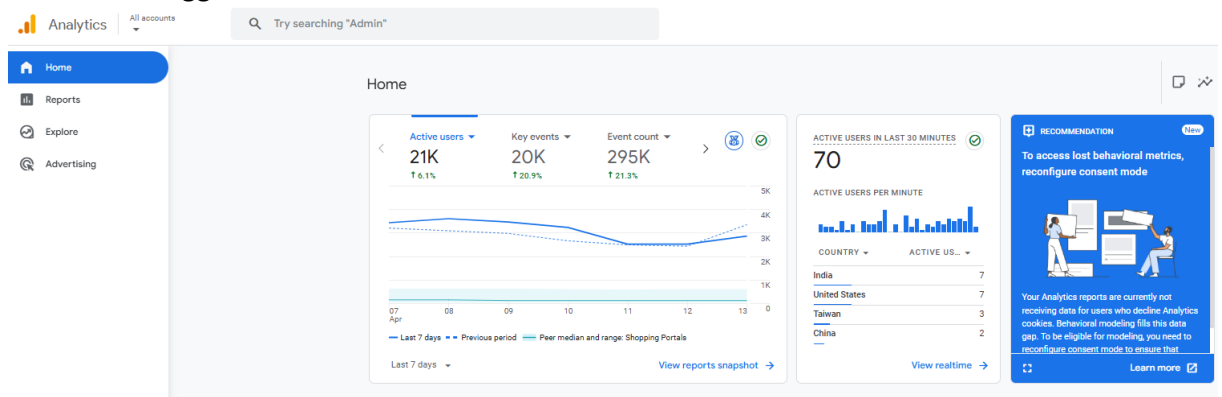

III. Customer revenue generation

IV. Customer retention.

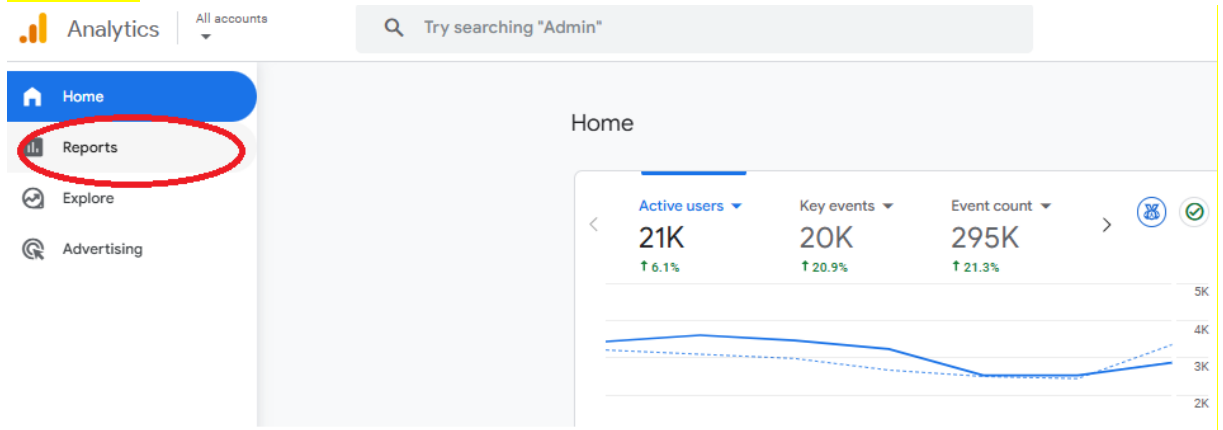

1. Analyses should consider user profiling:
 - i. User attributes (e.g., geographic location)
 - ii. Technologies used by users (mobile devices, tablets, desktops, operating systems, and web browsers).
2. Present and visualize the results in tables, charts, and graphs.
3. Present conclusions.
4. Describe all the above-mentioned tasks in a report. The report can be prepared in a text editor or as a Jupyter notebook. The codes presented should be editable.
5. A section regarding the analysis of Google BigQuery (BQ) may be added.

Example scenarios in Google Analytics

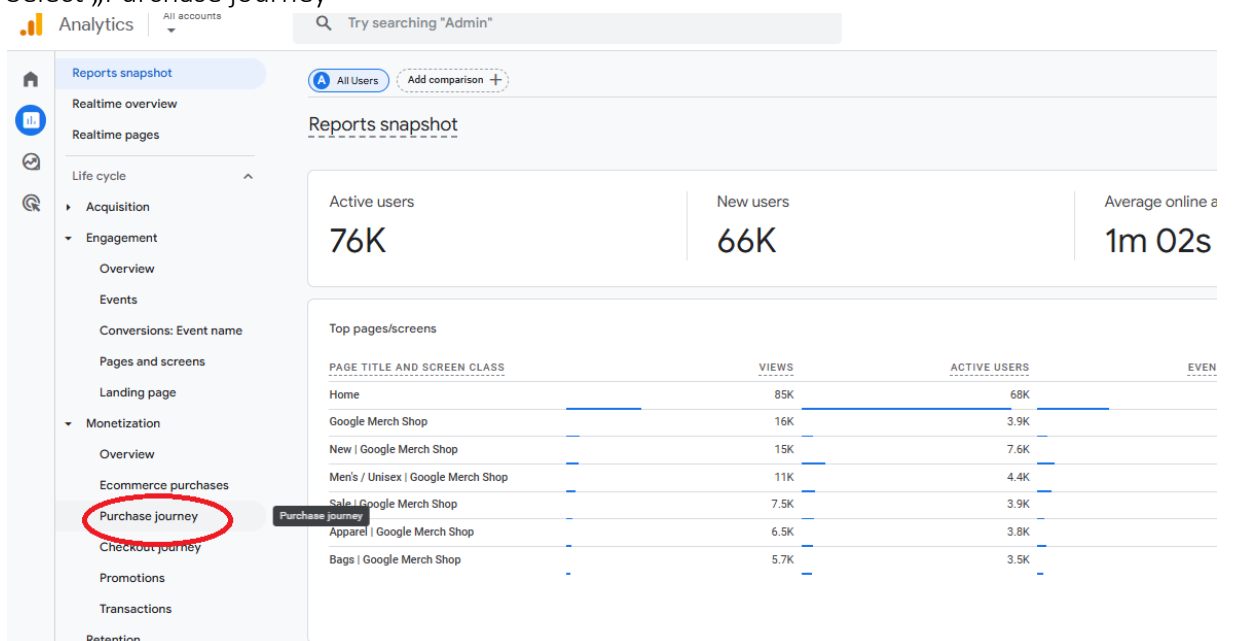

1. The demo Goggle Analytics account view

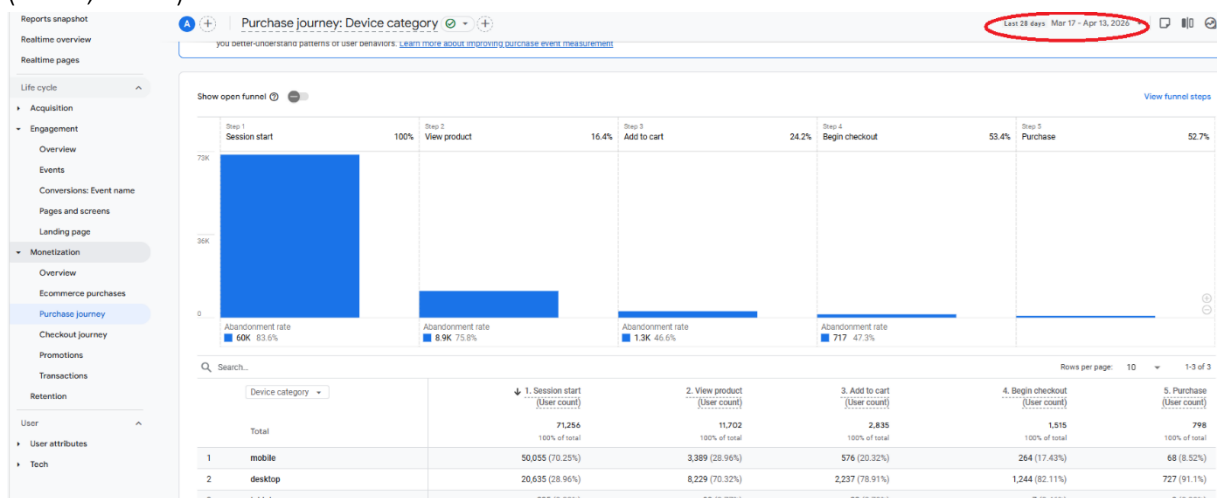

2. Example 1: Analysing reports

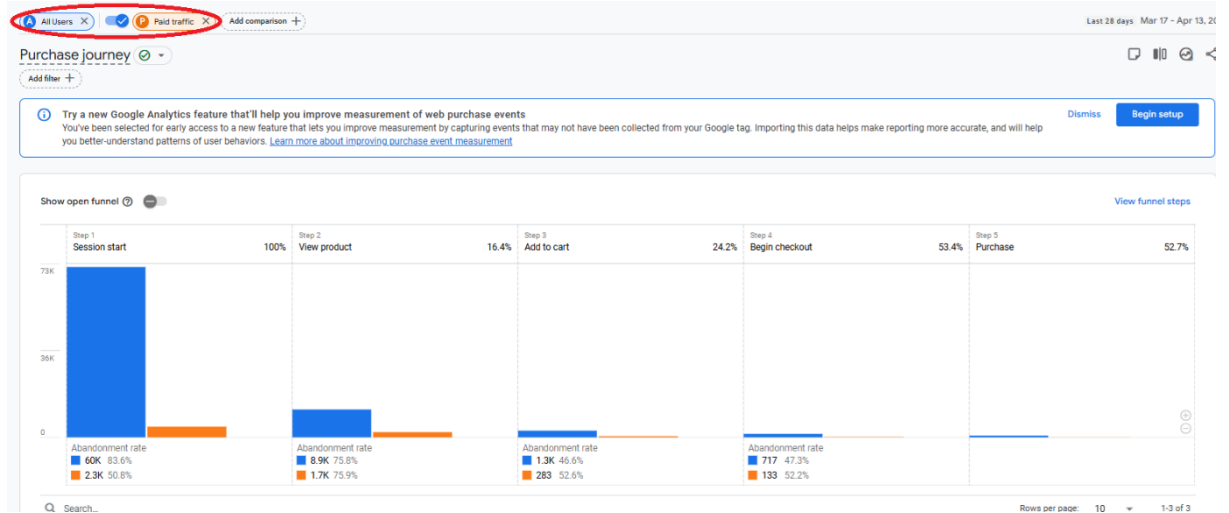

3. Select „Purchase journey”

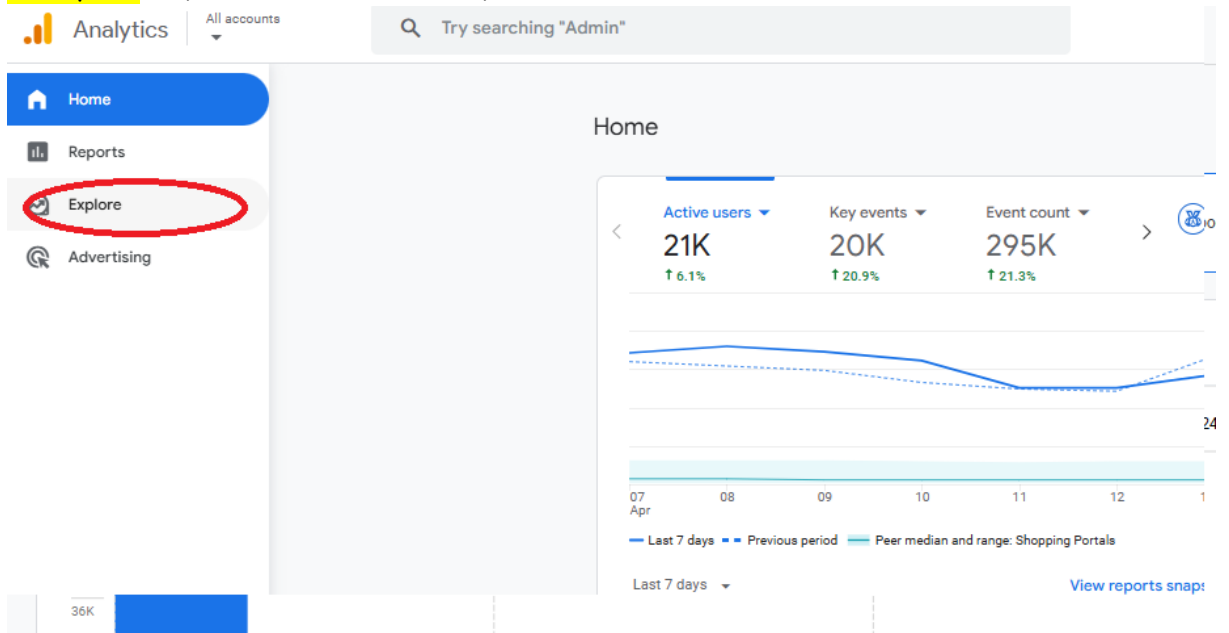

4. Following purchase journey steps will be available. It is possible to change the time (dates, hours).

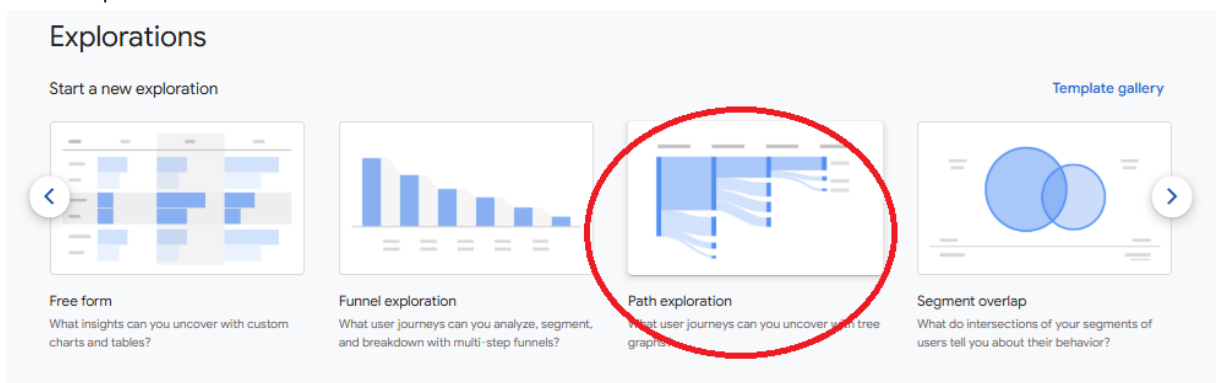

5. It is possible to filter and compare selected group of users (selected traffic).

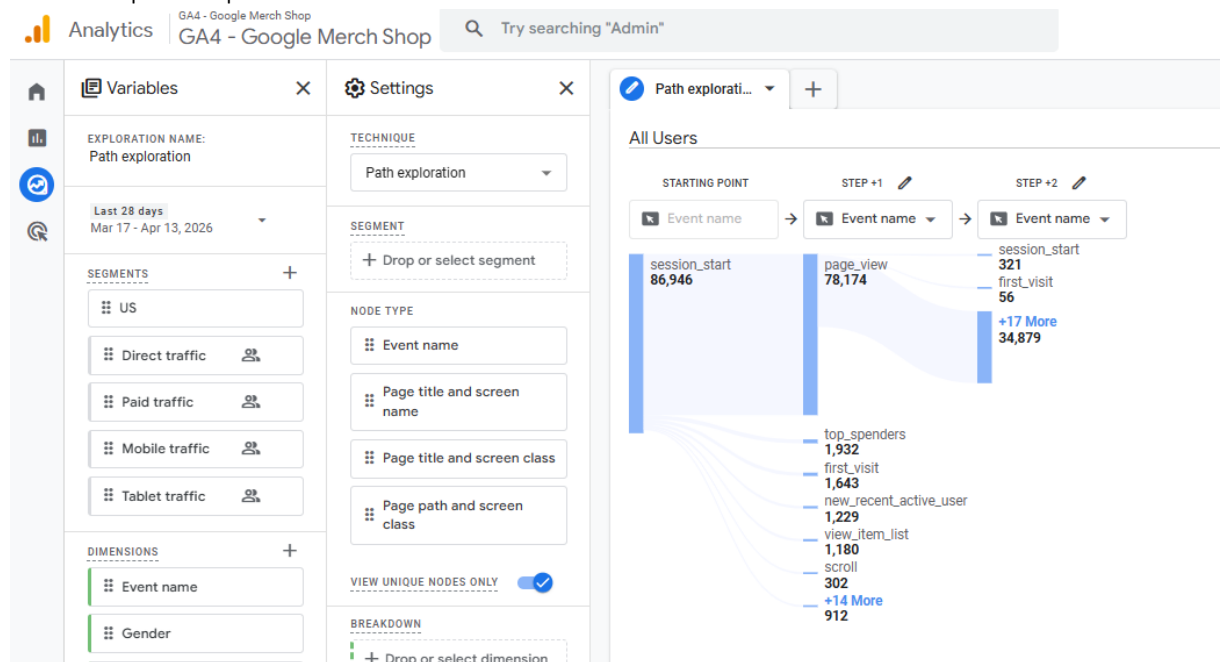

6. **Example 2:** Explore menu to make explorations

7. Path exploration

8. Result of path exploration
